

BEFORE THE PUBLIC SERVICE COMMISSION OF SOUTH CAROLINA  
COLUMBIA, SOUTH CAROLINA

PROCEEDING #18-11713

MARCH 14, 2018

2:45 P.M.

**ALLOWABLE EX PARTE BRIEFING - ND-2018-5-E**

SOUTHERN CURRENT LLC; CYPRESS CREEK RENEWABLES, LLC; ADGER SOLAR, LLC; NARENCO; ECOPLEXUS, INCORPORATED; OPDE GROUP; AND RENEWABLE PROPERTIES, LLC - Request for an Allowable Ex Parte Briefing Regarding Developments in Solar Independent Power Production in South Carolina

**TRANSCRIPT OF ALLOWABLE  
PROCEEDINGS**

**EX PARTE BRIEFING**

**COMMISSION MEMBERS PRESENT:** Swain E. WHITFIELD,  
CHAIRMAN; Comer H. 'Randy' RANDALL, VICE CHAIRMAN;  
and COMMISSIONERS John E. 'Butch' HOWARD, Elliott  
F. ELAM, Jr., Elizabeth B. 'Lib' FLEMING, Robert T.  
'Bob' BOCKMAN, and G. O'Neal HAMILTON

ADVISOR TO COMMISSION: Joseph Melchers, Esq.  
General Counsel

**STAFF:** Jocelyn G. Boyd, Chief Clerk/Administrator; F. David Butler, Esq., Senior Counsel; James Spearman, Ph.D., Executive Assistant to Commissioners; B. Randall Dong, Esq., and David W. Stark, III, Esq., Legal Advisory Staff; Thomas Ellison and John Powers, Technical Advisory Staff; Jo Elizabeth M. Wheat, CVR-CM/M-GNSC, Court Reporter; and Colanthia Alvarez and Calvin Woods, Hearing Room Assistants

**APPEARANCES:**

***RICHARD L. WHITT, ESQUIRE,*** representing  
SOUTHERN CURRENT, LLC; CYPRESS CREEK RENEWABLES, LLC; ADGER SOLAR, LLC; NARENCO; ECOPLEXUS, INC.; OPDE GROUP; AND RENEWABLE PROPERTIES, LLC

---

P R O C E E D I N G S

**CHAIRMAN WHITFIELD:** I'll call this allowable ex parte briefing to order and ask our attorney, Mr. Melchers, to read the docket.

**MR. MELCHERS:** Thank you, Mr. Chairman.

Commissioners, we are here pursuant to a Notice of Request for Allowable Ex Parte Communication Briefing. The parties requesting the briefing are Southern Current, LLC,; Cypress Creek Renewables, LLC; EcoPlexus, Inc.; NARENCO; Adger Solar, LLC; OPDE Group; and Renewable Properties, LLC.

The hearing is scheduled for today, March 14th here in the Commission hearing room at 2:45, and the subject matter to be discussed at the briefing today is: Developments in Solar Independent Power Production in South Carolina.

Thank you, Mr. Chairman.

**CHAIRMAN WHITFIELD:** Thank you, Mr. Melchers.

I'll now turn it over to the South Carolina Office of Regulatory Staff – Mr. Bateman? – for some instructions.

**MR. BATEMAN:** Good afternoon, Mr. Chairman, members of the Commission. Thank you.

Some of my introduction will repeat a bit of

1           what Mr. Melchers just said, and so I apologize for  
2           the repetition.

3           My name is Andrew Bateman and I'm a staff  
4           attorney for the South Carolina Office Of  
5           Regulatory Staff. I have been selected as a  
6           designee to certify that today's allowable ex parte  
7           briefing takes place in accordance with South  
8           Carolina Code 58-3-260(C)(6). That statute sets  
9           forth certain parameters and rules under which this  
10          briefing must take place, and if you will indulge  
11          me, I'm going to go over a few of those.

12          Mr. Richard Whitt, representing Southern  
13          Current, LLC, Cypress Creek Renewables, LLC,  
14          EcoPlexus, Inc., NARENCO, Adger Solar, LLC, OPDE  
15          Group, and Renewable Properties, LLC, requested  
16          this allowable ex parte communication pursuant to  
17          58-3-260(C). This presentation is limited solely  
18          to information noticed by the company, which was:  
19          Developments in Solar Independent Power Production  
20          in South Carolina. I therefore ask that everyone  
21          here please refrain from discussing any matters not  
22          related to what was noticed.

23          Secondly, the statute prohibits any  
24          participants, Commissioners, or Commission Staff  
25          from requesting or giving any commitment,

1           predetermination, or prediction regarding any  
2           action by any Commissioner as to any ultimate or  
3           penultimate issue which either is or is likely to  
4           come before this Commission.

5           Next, if I've counted my days correctly, a  
6           transcript of today's proceeding will be posted on  
7           the Commission's website by the end-of-day next  
8           Tuesday. Any document referenced or utilized today  
9           should be included with that posting.

10          Fourth, I'd ask the participants,  
11          Commissioners, and Staff refrain from referencing  
12          any reports, articles, statutes, or documents of  
13          any kind that are not included in today's  
14          presentation, to prevent the need from having to  
15          track down copies or links to these documents to  
16          include in the record.

17          I'd also note that none of the information  
18          contained in the presentation appears to have been  
19          marked or requested to be granted confidentiality,  
20          and I ask that the presenters refrain from  
21          referencing or discussing any confidential  
22          materials. This is a public briefing. And I ask  
23          that everyone please understand that, if the  
24          presenters decline to provide such information to  
25          questions here today. Please be understanding.

1           As a final note, please make sure to read,  
2           sign, and return the form you were given at the  
3           door when you came in today. This form needs to be  
4           signed by each attendee to certify the requirements  
5           contained in South Carolina Code Annotated 58-3-  
6           260(C) have been complied with at the presentation.

7           Thank you for your time, Mr. Chairman. This  
8           concludes my opening remarks.

9           **CHAIRMAN WHITFIELD:** Thank you, Mr. Bateman.

10          At this time, I'll now turn it over to Mr.  
11          Richard Whitt. Mr. Whitt, you've got quite a list  
12          here, so I'm going to let you get started.

13          **MR. WHITT:** Thank you, Mr. Chairman and  
14          Commissioners. And we certainly appreciate the  
15          opportunity to appear in front of you today. We  
16          also appreciate the assistance of Jo Wheat, who  
17          will have a lot of work to do in a quick period of  
18          time. We appreciate her help. We appreciate  
19          Andrew Bateman agreeing to appear today on behalf  
20          of ORS.

21          Mr. Chairman, if you will indulge me, I'd like  
22          to introduce some of my solar executives that are  
23          in the audience.

24          **CHAIRMAN WHITFIELD:** Yes, sir, go ahead, Mr.  
25          Whitt.

1                   **MR. WHITT:** All right. Thank you. We have  
2                   Aaron Halimi, from Renewable Properties. We have  
3                   Logan Stevens, from OPDE Group. We have Steffanie  
4                   Dohn, from Southern Current. We have Jesse  
5                   Montgomery, from NARENCO. We have Nathan Clark,  
6                   also from OPDE Group. And we have Tyler Norris,  
7                   from Cypress Creek. And the other – our presenters  
8                   will be introduced when we call the panel.

9                   We want to call the first panel, Mr. Chairman,  
10                  for 40 minutes. I'm going to try to note after 40  
11                  minutes is over, because our plan was to try to use  
12                  40 minutes for the first three panel presenters and  
13                  questions from the Commissioners, and the second  
14                  panel 30 minutes, to leave us at around 70 minutes.  
15                  And, certainly, if the Commissioners have  
16                  questions, we are glad to go beyond that, but we  
17                  understand everyone had a long drive last night and  
18                  a night hearing, so we want to try to hold it to  
19                  that, if we can.

20                  If you are ready, I can call the first panel.

21                  **CHAIRMAN WHITFIELD:** Yes, sir, Mr. Whitt. Go  
22                  ahead and call your panel.

23                  **MR. WHITT:** Thank you. We've got Bret Sowers,  
24                  from Southern Current. We've got Ben Snowden, who  
25                  is an attorney. And we've got Dr. Ben Johnson, who

1 is our consultant.

2 [WHEREUPON, Messrs. Sowers and Snowden  
3 and Dr. Johnson came forward.]

4 And, Mr. Chairman, I need to put on the  
5 record, as I always have to, that we have more than  
6 several attorneys that are here today as subject  
7 matter experts or as officers of my solar clients,  
8 but none of these attorneys are participating as  
9 attorneys. They're not admitted in South Carolina,  
10 and they're not participating as attorneys, but  
11 only subject matter experts or officers.

12 **CHAIRMAN WHITFIELD:** Thank you. So noted, Mr.  
13 Whitt. Thank you.

14 **MR. WHITT:** So we have a three-member panel,  
15 and we will note after 40 minutes.

16 **CHAIRMAN WHITFIELD:** Mr. Whitt, I'm not sure –  
17 I guess, Mr. Sowers is going to go first? But what  
18 I'd like to do is, like you said, is let – I would  
19 like for all three of you panelists to do your  
20 presentation before we take any Commissioner  
21 questions. So, Mr. Sowers, if you want to lead  
22 off, that would be fine.

23 **MR. BRET SOWERS [SO. CURRENT]:** Great, thank  
24 you.

25 [Reference: Presentation Slides 1-2]

1           Mr. Chairman, Commissioners, thank you for  
2           this opportunity to speak with you once again in a  
3           forum like this and to discuss topics that are  
4           important to our company and the six other energy  
5           companies joining me here today. I believe,  
6           Commissioner Bockman, we haven't had the chance to  
7           meet before. Pleasure to be in front of you today.

8           My name is Bret Sowers. I'm principal of  
9           Southern Current, based here in South Carolina  
10          with, now, over 80 full-time employees, and serve  
11          as the company's Vice President of Development and  
12          Strategy. I also have the pleasure of serving as  
13          Chairman for the South Carolina Solar Business  
14          Alliance, whose membership includes a diverse group  
15          of over 50 companies throughout the solar industry  
16          value chain.

17          Today, our objective is simple: Express to  
18          this Commission the developments made in the solar  
19          industry in South Carolina, driven by policy  
20          improvements, regulatory action, and private-sector  
21          growth. Along with my colleagues, we will discuss  
22          certain impediments to future growth in our sector  
23          and ways in which the solar industry's well-  
24          positioned to continue supporting an improved,  
25          clean, and more reliable energy infrastructure in

1 South Carolina.

2 Diversity in our State's energy generation  
3 mix, along with increased opportunities for the  
4 private sector to provide low-cost energy and  
5 capacity needs are ways in which we believe we can  
6 minimize price volatility and risk to ratepayers,  
7 and respond to increased consumer demand for  
8 cleaner forms of energy at low cost.

9 Today, the solar industry employs nearly 3000  
10 solar workers in South Carolina. Nationally, over  
11 250,000 workers are now employed in the solar  
12 industry, with nearly 53,000 of those dedicated to  
13 the large-scale solar segment, which we represent  
14 today.

15 We've provided you copies of our presentation.  
16 We hope you will follow along and ask questions at  
17 any time.

18 [Reference: Presentation Slide 3]

19 This slide here, the companies represented  
20 here today have a broad experience and a large  
21 geographical footprint in the United States,  
22 spanning across 31 states. Each state market poses  
23 its own set of opportunities for the solar industry  
24 to provide solutions. Our combined involvement  
25 working with various state commissions and staff,

1 utilities, legislatures, corporate energy users,  
2 and large communities has helped us shape our  
3 overall presentation today. As developers and  
4 asset owners, our continued improvement in grid-  
5 interconnection technological advancement and  
6 project finance is leading to increased deployment  
7 of large-scale energy plants.

8 [Reference: Presentation Slide 4]

9 Large-scale solar plants provide many economic  
10 benefits to South Carolina. Our combined planned  
11 investment will be over \$5.2 billion in South  
12 Carolina, leading to \$780 million in new job wages  
13 and nearly \$26 million per year in local property  
14 tax revenue. Our developments and assets provide  
15 many other benefits to South Carolina, its  
16 ratepayers, and the electrical grid. Rate  
17 stability is obtained through the deployment of our  
18 projects, through fixed long-term contracts and  
19 competitive avoided-cost rates. The construction  
20 and finance risk of our projects is borne by our  
21 companies and our financial partners, as we only  
22 receive payment for the energy we produce and not  
23 in advance.

24 Our companies recognize the need and privilege  
25 to give back. Contributions to workforce

1 development initiatives and support to charitable  
2 organizations in the communities in which we work  
3 are a few ways we hope to be a strong corporate  
4 citizen in South Carolina.

5 When constructing our facilities, often, grid  
6 improvements and modernization is required. This  
7 comes in the form of distribution and transmission  
8 infrastructure improvements, advanced metering and  
9 controls, and substation improvements. The cost to  
10 interconnect, along with these improvements, are  
11 borne by the solar energy company.

12 Other economic benefits are upstream and  
13 downstream supply chain, some of which are located  
14 here in South Carolina. Our segment supports a  
15 robust manufacturing base in the U.S., which  
16 supplies steel, aluminum, wire, transformers,  
17 inverters, and other electrical components to our  
18 projects.

19 As a transition to other presenters, I'd like  
20 to provide a brief layout of our presentation  
21 today. We will discuss interconnection impediments  
22 to project development, along with queue delays in  
23 progress, rate structures that support a more  
24 accurate valuation of the energy resource we  
25 provide, power purchase agreement nuances,

1 opportunities in new green tariffs, energy storage,  
2 and pending legislation. Thank you.

3 [Reference: Presentation Slide 5]

4 **CHAIRMAN WHITFIELD:** Go ahead, Mr. Snowden.  
5 Yes, sir, go ahead.

6 **MR. BEN SNOWDEN:** Thank you. Thank you, Mr.  
7 Chairman. Good afternoon, Mr. Chairman,  
8 Commissioners.

9 My name is Ben Snowden. I'm an energy and  
10 environmental attorney with Kilpatrick Townsend in  
11 Raleigh, North Carolina. My energy practice  
12 focuses on representing independent power producers  
13 in regulatory and contract matters. Most of my  
14 clients are developers of solar plants that are  
15 Qualifying Facilities under the federal PURPA  
16 statute. It's the Public Utility Regulatory  
17 Policies Act. Probably, you've heard of that one.  
18 I represent clients doing business in South  
19 Carolina and North Carolina, and in many other  
20 states throughout the U.S. I've also represented  
21 solar industry associations on regulatory issues  
22 both here and in North Carolina.

23 I was privileged to appear before this  
24 Commission last year in the allowable ex parte  
25 proceeding that was requested by the Solar Business

1 Alliance, where I talked primarily about regulatory  
2 issues of concern to the solar industry. I'm happy  
3 to have the opportunity to talk to you all again  
4 today about another issue that's of very serious  
5 concern to developers, and that issue is  
6 interconnection.

7 [Reference: Presentation Slide 6]

8 Right now, in South Carolina, the single  
9 biggest challenge to developers of utility-scale  
10 solar projects – the single biggest area of  
11 uncertainty – is getting interconnected to the  
12 electric grid.

13 Now, actually building a solar project doesn't  
14 really take all that long. You can accomplish that  
15 construction in, you know, a matter of months. But  
16 getting interconnected to the grid can take a lot  
17 longer, can take years, and interconnection is the  
18 single longest phase in the lifecycle of a solar  
19 project. And the amount of time that  
20 interconnection takes is almost entirely out of the  
21 developers' control. So when I talk about  
22 uncertainty, I'm talking about not only the costs  
23 of interconnection, the costs which – as Mr. Sowers  
24 mentioned – are borne by the developer, I'm also  
25 talking about uncertainty about time and how long

1           it takes to get interconnected.

2           The federal PURPA statute I mentioned requires  
3           utilities to purchase the output of Qualifying  
4           Facilities, and it also requires utilities to  
5           provide interconnection services so that those  
6           purchases can be made. But the jurisdiction to  
7           supervise those interconnections is in your hands,  
8           in the hands of the state commissions.

9           About two years ago, this Commission approved  
10          a new set of interconnection procedures for  
11          projects in South Carolina, and those standards  
12          were agreed on by a group of stakeholders,  
13          including ORS, the utilities, and the solar  
14          industry. And they were, as I said, approved by  
15          this Commission.

16                               [Reference: Presentation Slide 7]

17          Now, those interconnection procedures set out  
18          the steps for studying interconnections and also  
19          set out timeframes in which utilities are supposed  
20          to get that study work done. So, under those  
21          timelines, from the time an application for  
22          interconnection is submitted to when an  
23          interconnection agreement is issued should take  
24          about 260 business days for a project that's trying  
25          to interconnect to the distribution grid, and about

1 280 days for a project that is being interconnected  
2 to the higher-voltage transmission grid.

3 When we were here for the allowable ex parte  
4 last year, Mr. Sowers reported on the current  
5 status of the interconnection queue backlogs, and  
6 he reported that at that time the actual timeframes  
7 for interconnecting projects in South Carolina were  
8 running more than a hundred or so business days  
9 behind those timeline standards. I'll save the  
10 details; we do need to get into those, but suffice  
11 it to say that, in the last year, it has not gotten  
12 better. Interconnection timelines on the whole  
13 have gotten longer and the backlog of projects has  
14 gotten bigger – though I will observe that SCE&G is  
15 doing reasonably well hitting its marks on  
16 interconnection times.

17 Many of my clients have also seen very  
18 significant increases in interconnection costs over  
19 the last year. But my primary purpose here today  
20 is not to complain about delays in interconnection.  
21 What I do want to do, though, is talk a little bit  
22 about consequences of delays, because they can be  
23 very severe for projects.

24 So, one consequence of interconnection delays  
25 relates to the eligibility of specific projects for

1 the standard-offer rates in contracts for small  
2 Qualifying Facilities, those projects that are 2  
3 megawatts and under. Those rates expire on January  
4 1, 2019. That's 30 months after those rates were  
5 approved by the Commission, so this is sometimes  
6 referred to as the 30-month rule. So, even if you  
7 have a – when I say they expire, what that means  
8 is, even if you have a project that qualified for  
9 those rates and has done everything it needs to,  
10 it's done it all by the book, if that project can't  
11 go into operation by January 1, 2019, it loses  
12 access to those rates. It's not eligible; it has  
13 to kind of go back to the drawing board and get a  
14 new PPA, get new rates, which are probably going to  
15 be substantially lower. And a significant portion  
16 of the small utility-scale solar projects in South  
17 Carolina are subject to that deadline, which is  
18 really just around the corner. At the rate things  
19 are going, many of those projects, if not most, are  
20 not going to get interconnected in time to meet  
21 that deadline, as it's currently set out in the  
22 tariff.

23 A related issue has to do with negotiated  
24 contracts to sell power to utilities. Those are  
25 usually for bigger projects. Some of those

1 contracts include hard deadlines for achieving  
2 commercial operation. So if you don't meet the  
3 deadline, you may have to pay really significant,  
4 very significant liquidated damages, or the utility  
5 may be able to cancel that contract. And one might  
6 think that those contracts with those deadlines  
7 would include provisions that allow the deadline to  
8 be extended, where interconnection is the only  
9 reason the project can't go on-line in time, but  
10 very often those contracts don't include that kind  
11 of provision. So in either situation, you have a  
12 developer that may have followed all the rules and  
13 lived up to its responsibilities, but, because it  
14 cannot get connected in time to meet these  
15 deadlines, it loses its PURPA rights. So that's a  
16 very serious issue.

17 [Reference: Presentation Slide 8]

18 Now I'd like to turn to another issue, and  
19 this is the technical screens and study methods  
20 that get used in the interconnection process. Now,  
21 I'm a lawyer, so I'm not capable of getting too  
22 technical, so don't worry about that. But the most  
23 time-consuming part of the interconnection process  
24 is what's called the system impact study. So the  
25 system impact study is the part of the process

1 where the utility assesses, studies the impacts of  
2 the project, or the potential impacts of the  
3 project to the grid: What's going to happen if  
4 someone builds this project as it's designed? And  
5 projects are studied under several sets of  
6 conditions, right? What are the impacts during  
7 high-load scenarios, what are the impacts during  
8 low-load scenarios? What happens if, you know, a  
9 tree falls down and cuts the line, what's going to  
10 be the impact of having this project? What are the  
11 problems that can arise, and what can be done to  
12 address those problems or prevent them?

13 So the system impact study is performed by the  
14 utility's engineers, and the utility has to make a  
15 lot of judgment calls when it's performing that  
16 study. So what kind of tests are applied, you  
17 know, how rigorous are those tests, you know, what  
18 are the kinds of conditions that you want to test  
19 under, you know, what kind of solutions get  
20 considered or are on the table to address those  
21 problems?

22 The system impact study is actually necessary;  
23 it's required by the procedures. But the choices  
24 that are made by the utility about how to conduct  
25 the study can have a huge impact on the time that's

1 required to perform the study and on the ultimate  
2 outcome. I think of it a little bit like building  
3 codes inspections. Everybody understands they're  
4 necessary, but they can also be unreasonably  
5 restrictive. So, if you are, you know, building a  
6 house on Folly Beach, it's probably pretty  
7 reasonable for the building code to require that  
8 house to be able to withstand, you know, 140-per-  
9 mile-an-hour winds, or 150-mile-per-hour winds, and  
10 maybe be limited in height to 35 feet, say. And  
11 that's probably pretty reasonable. But is it  
12 reasonable for the building codes to require the  
13 house to withstand, you know, 300-miles-per-hour  
14 wind? Can you even build a house like that? You  
15 know, what if the building code limits the height  
16 to 20 feet? Is that reasonable? And each  
17 inspection that has to happen sort of adds  
18 incrementally to the costs of the house and the  
19 time that's required to build the house. And if  
20 you want to keep anybody from building houses on  
21 Folly Beach, it's not that hard to adjust the  
22 building code to make it so it's just uneconomical  
23 to build a house there.

24 So a problem that arises is there's very  
25 little transparency as to what the technical study

1 criteria are that the utilities are using in these  
2 interconnection studies: What are the policies? To  
3 the extent that there are consistent procedures,  
4 they're not published or otherwise made available  
5 to developers when those developers are planning  
6 and designing their projects, which is when you  
7 really need to know about the policies, because if  
8 you know what the technical requirements are, if  
9 you know what the conditions are at specific points  
10 of the grid, you can make a reasonable call about,  
11 you know, whether it's a good idea to build a plant  
12 of a certain size in a certain place. Without that  
13 information, it's very difficult to make informed  
14 decisions.

15 Unfortunately, that information is just, you  
16 know, not really available when it's needed. What  
17 is even more problematic is that changes have been  
18 made to these technical policies that have been  
19 applied not just to new projects coming into the  
20 interconnection queue, but have been made to  
21 projects that were already in the queue – sometimes  
22 had been in the queue for months or years or, you  
23 know, longer than they should have been. And there  
24 have been several instances, over the last two  
25 years or so, where a utility has introduced a new

1 technical policy that has made the interconnection  
2 standards effectively much more stringent. And,  
3 again, these were introduced with respect to, you  
4 know, all projects in the queue that had not  
5 finished the system impact study phase. To go back  
6 to our, you know, building code analogy, it's as  
7 though you had submitted your building plan for  
8 approval, it was supposed to come back in six  
9 weeks. Fourteen weeks later, you know, the code  
10 department comes back and says – or inspection  
11 people come back and say, "Sorry," you know, "we've  
12 reduced the – or, increased the setbacks or reduced  
13 the maximum building site. I'm sorry, you can't  
14 build your house this way."

15 So, what is the impact, or what has the impact  
16 of these changes been? For some projects, the  
17 screens have been applied and the result is,  
18 "Sorry, you can't build your project here," or,  
19 "You can't interconnect your project here." Or,  
20 "If you do, you've got to build a \$5 million  
21 transformer to interconnect here," or, "You've got  
22 to cut the size of your project in half or," you  
23 know, "by 75 percent." And even when the impacts  
24 haven't been quite that drastic, it has been the  
25 case that they've been – the economic impact has

1           been enough to make the project nonviable, so the  
2           projects have been withdrawn from the queue. And  
3           that really has happened to quite a lot of  
4           projects. And for almost all projects, even those  
5           that haven't really been negatively impacted  
6           economically, the additional studies have  
7           significantly increased the amount of time it takes  
8           to perform the system impact study, and this has  
9           made the interconnection backlog even worse.

10           Although the solar industry has been informed  
11           of these changes, you know, in most cases the  
12           utility has not been receptive to the industry's  
13           input on the policies themselves or on the  
14           potential strategies for dealing with the concerns  
15           that were raised by the studies – which is a shame,  
16           you know, not only because this, in my view at  
17           least, has undermined the relationship between the  
18           industry and the utilities, but also because it  
19           shuts down a lot of potential innovation that could  
20           result from a more collaborative working  
21           relationship.

22           The companies that are represented in this  
23           room here today, they have a lot of collective  
24           technical expertise. They're doing business with  
25           utilities all over the country, and they have a lot

1 of good ideas for addressing safety and reliability  
2 concerns that may come with interconnecting more  
3 projects to the grid. Some of these solutions,  
4 like smart inverters, you might've heard of, are  
5 already in widespread use elsewhere, but the  
6 utilities here have not been particularly receptive  
7 to them.

8 [Reference: Presentation Slide 9]

9 So one final issue that I want to bring to  
10 your attention, that relates to interconnection, is  
11 the North Carolina Competitive Procurement for  
12 Renewable Energy Program. Some of you all may have  
13 heard last year the North Carolina Legislature  
14 passed a bill called HB 589 that requires Duke to  
15 procure 2660 megawatts of new renewable capacity  
16 over the next four or so years. Why am I telling  
17 the South Carolina Commission about this North  
18 Carolina law, you may ask. And the reason is that,  
19 in Duke's South Carolina service territories,  
20 projects in those territories may bid into the  
21 North Carolina program and may win contracts  
22 through that.

23 What does this have to do with  
24 interconnection? The current interconnection  
25 backlog is a problem. At the rate things are

1           going, it may be that not very many projects in  
2           South Carolina will be far enough along in that  
3           interconnection process to effectively and  
4           competitively bid into that CPRE Program. The  
5           industry and Duke have had discussions, ORS has had  
6           discussions in the past, about possible ways to  
7           address this, possibly special interconnection  
8           procedures to deal with this issue. We have not  
9           reached consensus. The solar industry has a lot of  
10          concerns about – well, we have not reached  
11          consensus on a proposal, but you may see some  
12          proposals come to you at some point in the near  
13          future.

14                The most important take-away that I have, the  
15                biggest concern I think for the solar industry, is  
16                just that any changes that are made not have a  
17                negative impact on projects that are already under  
18                development in South Carolina.

19                Thank you so much for your time.

20                [Reference: Presentation Slide 10]

21                **DR. BEN JOHNSON [BEN JOHNSON ASSOC'S]:** Good  
22                afternoon. Thank you for having me back. You may  
23                recall I was here a year ago during a similar  
24                presentation.

25                I'm an economist, and I'm going to sort of

1 change the tone just a little bit from being mired  
2 in the difficulties of the moment to talk a little  
3 bit about being more forward-looking. My focus is  
4 going to be on the part of regulation that affects  
5 this industry in terms of the rates that are paid,  
6 the revenues that these companies receive.

7 Let me start by trying to point out something  
8 that I'm sure you're aware of but maybe don't think  
9 that often about, that these companies are kind of  
10 unique in that, on the one hand, they have to have  
11 a very close working relationship with the  
12 incumbent utilities on matters like interconnection  
13 and, in effect, in some sense, the incumbent  
14 utilities are their customers, because that's who  
15 is the mechanism by which their power reaches  
16 ultimate users. But in another very important  
17 sense, they are independent power producers, and  
18 that word "independent" gets to the essence of what  
19 Congress had in mind, which was to create a class  
20 of competitive firms out in the states who would  
21 bring sort of a separate viewpoint, a separate  
22 perspective, on the electric industry. It kind of  
23 created a carve-out and said, you know, all those  
24 states continue to have incumbent monopolies that  
25 control the grid and have the bulk of the

1 investment in generating units. What Congress did  
2 was allow an opportunity for small companies to be  
3 more innovative, as long as they stayed small, and  
4 any one project had to be 80 megawatts or less,  
5 about a tenth of the size of a typical large base-  
6 load plant, and, in fact, most projects that these  
7 companies actually build are quite a bit less than  
8 that, more like 20 megawatts or even 5 megawatts.

9 As long as they're small, they have an  
10 opportunity to sell as much power as they want and  
11 develop as much energy capacity as they want, as  
12 long as they're paid at an amount that won't harm  
13 customers over the long run. In essence, they get  
14 in the front of the line and can build plants and  
15 produce energy using specified technologies –  
16 basically, hydro, solar, wind, other types of  
17 renewable energy like recycling, burning trash,  
18 things of that sort.

19 Solar, in particular, has been an opportunity  
20 that's been there for many years, and around the  
21 world it's been growing, but in the United States,  
22 other than a relatively small number of places  
23 where mandated programs or procurements have  
24 occurred, by far the greatest penetration has  
25 occurred in locations like South Carolina and North

1 Carolina that have taken advantage of this  
2 opportunity under Congress that basically allows  
3 small developers to come in and build competing  
4 generating sources to generate power. And their  
5 business model's potentially very flexible; they'd  
6 be very interested in selling directly to  
7 customers, transferring their power across the grid  
8 to large users like Google, and the like, where  
9 they are given the opportunity, but the basic entry  
10 point is this opportunity under PURPA to sell power  
11 at what is called avoided cost.

12 The key thing to keep in mind is that they  
13 are, in effect, competitors of the incumbents, so  
14 to the extent the typical process is one in which  
15 the incumbent utility kind of decides what the  
16 rules of the game are and decides how many plants  
17 should be built and where and what technology to  
18 use, this is kind of a very special case exception,  
19 because Congress basically says let these  
20 innovative companies take the risk, let them try to  
21 build things, and they're just capped at the amount  
22 that the incumbent would have spent if they had  
23 built their own plant and operated it.

24 And as I say, this is a chance to be kind of  
25 forward-looking. It's an interesting contrast to

1 the earlier part of the day when I watched you work  
2 through a series of fairly routine filings that  
3 needed to be approved. This is a chance for you to  
4 start thinking big picture, do you want South  
5 Carolina to, in fact, be forward-looking and an  
6 innovative state that shows what can happen? You  
7 already have more interest and innovative ideas and  
8 entrepreneurial energy happening in the solar  
9 industry in South Carolina than a state like  
10 Florida that has a lot more solar, but Florida has  
11 not been using the PURPA process in the same way.  
12 They tend to be more procurement-oriented, where  
13 the incumbent goes out and gets bids and builds and  
14 owns solar plants on kind of a bureaucratically  
15 decided basis. They decide how much solar to have,  
16 and then the incumbent builds it, and customers are  
17 responsible for the cost.

18 What's happening in South Carolina is very  
19 different, because the customers are not taking any  
20 of the risks, and all they are paying is the  
21 equivalent cost of what the incumbent would've  
22 spent. To the extent these firms lose money  
23 because they are betting on the technology being  
24 cheaper than it actually turns out to be, that's  
25 their problem. They get contracts for, say, 15

1 years, but they're still taking all the risk of  
2 what happens in the remaining years after that 15-  
3 or 20-year initial contract. The plant will  
4 probably last 30 years, might last 35 – we're just  
5 not sure, because the technology is fairly new.  
6 They are taking that risk. They have to decide how  
7 much they can afford to guess they're going to get  
8 on the back end. And that's very different than  
9 the way the incumbent would do it. If they build a  
10 coal plant, they expect it to last 40 years. If  
11 it's obsolete after 20 and really shouldn't be run  
12 anymore, the ratepayers still pay for it and they  
13 continue to pay for that cost even though it didn't  
14 turn out right.

15 [Reference: Presentation Slide 11]

16 So, the thing to keep in mind here is that a  
17 key piece in this whole puzzle is the tariffs that  
18 you approve for what's called QF rates.

19 [Reference: Presentation Slide 12]

20 The methodology is basically set by FERC, and  
21 it's still valid. It's called the avoided-cost  
22 methodology, and it's fairly flexible. But what is  
23 needed are some updates and improvements in how we  
24 apply that methodology. And I'm not going to try  
25 to get too specific here today. I understand this

1           isn't the time or place to do that. I'm just  
2           trying to give you a sense that there are  
3           opportunities and there are pitfalls in front of us  
4           at this point, as the solar industry grows, and the  
5           potential – we're talking about billions of dollars  
6           in investment that's ready to come into South  
7           Carolina and, again, with no downside risk, no  
8           upside in terms of cost to customers. But that  
9           opportunity is not going to materialize if they  
10          can't get interconnected, and it's not going to  
11          materialize if all the rates are suddenly changed  
12          or there's a lot of uncertainty that people can't  
13          figure out what their revenue stream's going to be.  
14          The – and what I want to point out is, again,  
15          forward-looking, there are some issues that are  
16          arising both nationally, internationally, and here  
17          in South Carolina specifically, that really would  
18          call for improving and refining the process.

19                       [Reference: Presentation Slide 13]

20           Specifically, we've got changing industry  
21           conditions. There's a number of them. I don't  
22           have time to go into all of them, but, again, I've  
23           hinted at it. You have coal plants that are no  
24           longer as efficient to operate as they once were;  
25           they're not as cost-effective as they were expected

1 to be. A big one that you're going to hear about  
2 in the news is the fact of growing importance of  
3 solar. And that's certainly – if South Carolina is  
4 going to be one of the leading states for producing  
5 solar, both for your own needs and potentially  
6 exporting it to adjacent states that aren't as  
7 friendly to solar, then you've got to recognize  
8 there's technical characteristics to that and you  
9 have to update the avoided-cost calculations and  
10 the tariff process to avoid problems that result  
11 from having a lot of solar on your system that we  
12 haven't dealt with in the past.

13 But there's also technical changes right on  
14 the horizon that are being used on other continents  
15 – Europe and South America – and starting to be  
16 used in America, like solar plus storage, which is  
17 a perfect solution to many of these problems. We  
18 talked about smart inverters. Similarly, you can  
19 put a certain amount of storage right next to a  
20 solar plant. You can be drawing power off the sun  
21 and putting it into that battery in the heat of the  
22 day, around noon – which is not the absolute  
23 maximum time when people use power because things  
24 tend to slow down during the lunch hour – and then  
25 you can use that power later in the afternoon or in

1 the beginning of the evening, as the sun is  
2 starting to come down but houses are still hot, the  
3 air conditioners are still running. There's a kind  
4 of a critical hour at about 6 or 7 o'clock when  
5 it's the perfect time to pull solar power back out  
6 of the batteries and send it back out to the grid.  
7 Once that battery is there, you have the potential  
8 to use it again in the morning to anticipate even  
9 before the sun comes up, if you pull it out of the  
10 grid off of some of those older coal plants or  
11 other sources that might otherwise be underutilized  
12 late at night. With proper price signals, you  
13 could be filling that battery off the grid. Under  
14 PURPA, that's perfectly legitimate. You're  
15 supposed to have the right to buy and sell at  
16 wholesale.

17 So the opportunities are there, but the  
18 concerns are there. I also want to mention a  
19 potential for older, costly generators. The  
20 existing utilities, incumbents, are tending to not  
21 want to talk a whole lot about them, because it's a  
22 bit of an embarrassment for them. But it's not  
23 their fault; the reality is, all through the  
24 country we have coal plants that probably should've  
25 been retired at age 30 or 35, but they're still

1 sitting there at age 38 or 40, and they're very  
2 costly to maintain, costly to keep available.  
3 Properly handled, that is one of the things that  
4 you'd be looking at, saying, "Well, maybe we should  
5 accelerate the process of switching over to solar,  
6 and perhaps retire some of those plants. Or  
7 perhaps, in some cases, no, but change the way we  
8 use them, and use them only during certain parts of  
9 the year when the need is greatest."

10 [Reference: Presentation Slide 14]

11 The essence of what is needed – again, trying  
12 to keep this at a very high level – is we need more  
13 granular rates. We cannot continue to have QF  
14 rates that are as simple as – or virtually as  
15 simple as – the ones that the average house uses.  
16 It does not make any sense. If you have a \$100  
17 million investment and you've got millions of  
18 dollars' worth of revenue going on, it does not  
19 make sense to assume that the producer of that  
20 energy, the independent power producer, is  
21 incapable of understanding a price that's changing  
22 every 15 minutes. It does not make sense to assume  
23 they're incapable of understanding there is a  
24 difference between a very hot summer day when  
25 everybody knows all the air conditioners are

1 running and that power's very valuable, and a  
2 cooler day with a thunderstorm. Why not give them  
3 a proper price signal that recognizes those  
4 differences? Again, it's not that they are not  
5 capable of adapting and reacting and building  
6 investments, long-term investments, based on very  
7 precise price signals; the problem is that the  
8 incumbent utilities have had no incentive to  
9 produce those price signals. And I'm not putting  
10 any kind of criticism of any specific utility or  
11 the utilities here in the State. This is a problem  
12 nationwide. They're very slow to adapt and get  
13 more precise about things.

14 You have things like winter peaks in early  
15 morning that are only a few times, a few hours, of  
16 the year, sometimes only a few years out of every  
17 decade. It obviously does not make sense to build  
18 an entire peaking plant or to design all your rates  
19 around that problem of just a few hours a year,  
20 when the correct response is something like demand  
21 response, where you basically have your major  
22 manufacturers be willing to be interruptible. Give  
23 them some notice that, "We're going to have a cold  
24 snap. We have a polar vortex." Shut down the  
25 plant for a few hours in the morning, and give them

1 a reward for that that's very significant to their  
2 bottom line but it's still a lot less than what it  
3 costs to have a peaking plant. That kind of  
4 precision is needed, and it's similar to this  
5 question of storage. If storage with solar will  
6 work, if you have the price signals, if a solar  
7 developer knows that, by adding storage, every  
8 couple of years he's going to be paid a real big  
9 premium for having that energy ready early in the  
10 morning before the sun comes up, when it's needed –  
11 but if you just give him a bland price signal that  
12 ignores that phenomenon, then he's not part of the  
13 solution and that opportunity for innovation  
14 doesn't take place.

15 [Reference: Presentation Slide 15]

16 So, more specifically, where the need is –  
17 again, forward-looking – is we need hour-by-hour  
18 differences in avoided cost. There's no reason not  
19 to be presenting that to you, presenting that to  
20 ORS, and to be using that in the actual tariff.  
21 The underlying modeling that's been done for years  
22 is on an hour-by-hour basis, but it's never  
23 presented to you. And it's generally not presented  
24 to myself as a consultant or the other independent  
25 power producers around the country, who could be

1 looking at that information and understanding,  
2 “Okay, what are the trade-offs? How much storage  
3 should I associate with this solar plant?” If they  
4 can see the hour-by-hour differences, they could  
5 start planning ahead. And if we put that into the  
6 tariff, then they’ll have opportunities to respond  
7 to that.

8 I mentioned weather-related differences. In  
9 particular, we ought to give solar credit for the  
10 intuitively obvious notion that solar tends to be  
11 producing a lot during the hottest days, when it’s  
12 most valuable, but we tend to ignore that. There’s  
13 no weather component being broken out in a typical  
14 avoided-cost development. There’s no recognition  
15 of the fact that there is a correlation between  
16 solar output and customer need, in terms of air-  
17 conditioning load.

18 In terms of coal ramping, it’s fairly  
19 technical but it’s a very important issue that’s  
20 starting to be more and more important, as solar  
21 increases and as coal is no longer as effective.  
22 Coal plants that were intended to be used as base-  
23 load plants are now being used as cycling plants.  
24 It’s not what they were designed for, but that’s  
25 just the reality of low natural gas costs per MBtu

1 and better heat rates that the natural gas plants  
2 have. So there are optimal responses, but I'm not  
3 seeing, as an industry, the responsiveness we need.  
4 And what I'm suggesting to you, as regulators, is  
5 you can encourage the industry to actually study  
6 the optimal response and create an opportunity for  
7 innovative solutions. Again, solar plus storage is  
8 the one obvious example I can point to. With  
9 storage, it becomes part of the solution to that  
10 ramping problem. The ramping problem, in essence,  
11 is that the coal plants are very slow to increase  
12 their amount of power and they're slow to reduce  
13 the amount of power.

14 There's other things. The existing pumped  
15 storage needs to be used more effectively to deal  
16 with that. And properly paired with solar, it's an  
17 excellent bridge to the future. Until storage  
18 becomes more widespread, simply using existing  
19 pumped storage facilities to help take – concentrate  
20 the output during the late afternoon or early  
21 evening as, again, I mentioned people are coming  
22 home, the building hasn't yet cooled down so there's  
23 still a fair amount of usage, but the solar is no  
24 longer producing. It's a perfect time to be using  
25 pumped storage. And pump during the middle of the

1 day when the solar is at its max. If you had the  
2 proper price signals, the existing owners of that  
3 pumped storage, the incumbent utilities, would have  
4 the incentive to operate it in the logical way that  
5 I'm describing.

6 There's also opportunities in wholesale  
7 markets. There's a hydro plant in North Carolina  
8 that is in the wholesale market; it sends its power  
9 to PJM, currently. It's a perfect opportunity to  
10 give them a premium price in the early morning and  
11 a premium price in the late afternoon, in  
12 conjunction with solar. But they have to get –  
13 wheel the power into South Carolina. It's a fairly  
14 short distance. There's no price signal, there's  
15 no incentive for them to do that. It's easier for  
16 them just to go into the PJM market where they are  
17 given a reward that is somewhat responsive to those  
18 characteristics. But there's, in essence, an  
19 arbitrage opportunity because South Carolina has  
20 more solar than the PJM market, places like New  
21 Jersey, that the value of power at the noon hour is  
22 going to be cheaper, so that hydro plant shouldn't  
23 be running at noon. It simply doesn't make sense.  
24 It should save its power and then use it in the  
25 late afternoon, when the value is there. But,

1 again, it takes a proactive effort by the  
2 regulators to encourage the kind of environment  
3 where people start thinking about these things and  
4 actually optimizing the overall portfolio and  
5 creating opportunities for innovative thinking.

6 Similarly, you've got other existing plants  
7 that exist, that could be given the proper signals  
8 to change the way they're dispatched, and instead  
9 of selling their power up into PJM sort of on a  
10 blanket price, give them an incentive to produce  
11 power again when we need it the most, and then the  
12 balance of the time, they'll take their chances on  
13 what they get in the PJM market. You're just  
14 giving them a small premium but all of a sudden it  
15 becomes very attractive, but, again, no one's doing  
16 that, no one's offering it. There's no mechanism  
17 to encourage that activity. The mind set on the  
18 incumbent utilities everywhere, including –

19 **MR. WHITT:** Dr. Johnson, excuse me. I  
20 apologize profusely.

21 **DR. BEN JOHNSON [BEN JOHNSON ASSOC'S]:** Sure.

22 **MR. WHITT:** If we're going to keep to our  
23 promises that we made, could you go ahead and  
24 conclude?

25 **DR. BEN JOHNSON [BEN JOHNSON ASSOC'S]:** Fair

1           enough. I appreciate that.

2           Anyway, what we need is – let me move to my  
3           last slide.

4                       [Reference: Presentation Slide 16]

5           Here we go. – we need updates and  
6           improvements. The need is real. I'm sorry for  
7           going a mile a minute. I just get excited about  
8           all these opportunities I see, looking forward.  
9           The industry wants to help. They want to be part  
10          of the solution, not part of the problem. But we  
11          need a process that's open, that's transparent, and  
12          that's collaborative. And that's part of the theme  
13          you heard a moment ago, in terms of the  
14          interconnection process.

15          It needs to be more collaborative. The solar  
16          industry needs to have more of a seat at the table  
17          to help solve these problems and help the State  
18          grow and help the State take advantage of its  
19          opportunity of being here in the South where solar  
20          energy is so abundant.

21          So that's the essence of what I'm saying, and  
22          I appreciate your time, and I apologize for running  
23          a bit late.

24          Questions? I think this is our opportunity  
25          for this panel.

1                   **CHAIRMAN WHITFIELD:** I'd like to thank you,  
2                   Dr. Johnson, Mr. Snowden, and Mr. Sowers.

3                   And Mr. Whitt, thank you. I do want to keep  
4                   on the schedule that you mentioned from the  
5                   beginning, for a lot of reasons but also for our  
6                   court reporter, as you mentioned, who had a late  
7                   night with us last night.

8                   So I will, at this time, just take a brief  
9                   minute for any questions before we let this panel  
10                  step down. Commissioners, are there any questions  
11                  that any of you really feel a burning need to ask  
12                  of this panel before we let them step down?  
13                  Commissioner Bockman, if you have one, go ahead,  
14                  because –

15                 **COMMISSIONER BOCKMAN:** One question.

16                 **CHAIRMAN WHITFIELD:** – because we're about to  
17                 let them step down, so go ahead, Commissioner  
18                 Bockman.

19                 **COMMISSIONER BOCKMAN:** Let me ask Dr. Johnson,  
20                 on your next-to-last slide, "Rates and  
21                 Improvements: QF Rates Should Accurately Reflect  
22                 Subtle Nuances," are there places where you might  
23                 direct us where these things have occurred?

24                 **DR. BEN JOHNSON [BEN JOHNSON ASSOC'S]:** I'm  
25                 not aware of any state that is being as aggressive

1 as I think that I'm talking about what is needed.  
2 I think the opportunity truly is these green-field  
3 opportunities here. The specific concepts, they're  
4 studying them in great depth in a state like New  
5 York, but it's a very bureaucratic process and I  
6 wouldn't point to it as a success story,  
7 necessarily.

8 **COMMISSIONER BOCKMAN:** Thank you, Dr. Johnson.  
9 And thank you, Mr. Chairman.

10 **CHAIRMAN WHITFIELD:** Thank you, Commissioner  
11 Bockman.

12 Commissioner Fleming.

13 **COMMISSIONER FLEMING:** Yes.

14 Thank you very much for being here. I wish we  
15 had more time than we have. I heard a lot of  
16 uncertainties that's going on locally, meaning  
17 North Carolina and South Carolina, and how the two  
18 states are impacting each other. Could you talk a  
19 little bit about, though, how the rules are  
20 changing? It seems to be that it's constantly  
21 changing, rather than being consistent, so that  
22 you're having a hard time holding on. And, also,  
23 the impact of the HB 489<sub>[sic]</sub>, the amount that's being  
24 required in North Carolina, how that's impacting –  
25 if it is impacting – what's happening in the queue

1 in South Carolina.

2 MR. BRET SOWERS [SO. CURRENT]: Thanks for the  
3 question. I'll lead off and I think probably Ben  
4 Snowden may be best to finish, I think.

5 To address why we've talked about it a lot  
6 here today, on the uncertainty issue – and I think  
7 I brought this up in the previous ex parte – as  
8 small power producers, to enter into the  
9 interconnection process, it costs a fee; we have to  
10 spend money to enter into the process and then,  
11 during that process, we have to continue to invest  
12 in permitting, in local development, additional  
13 study timelines. And all that is cost incurred in  
14 a process, but we go into that process knowing what  
15 the set rules are. So in this case, in South  
16 Carolina, the South Carolina Interconnection  
17 Standard is what we look to before we go invest  
18 \$10,000 into just submitting a project.

19 When the rules are changed or adapted or moved  
20 as we're in that process, I then, as an owner of a  
21 company, may say, "Well, I would've never spent  
22 that \$10,000." Or in most cases, on an average  
23 system, we're spending between \$50,000 and \$150,000  
24 before we ever get to a process where we actually  
25 get to build a project.

1 I'll leave it at why the uncertainty is huge  
2 for us. And why that causes a lot of problems: Our  
3 company, in particular, has over 100 projects in  
4 South Carolina, in the interconnection queue, and  
5 add that by the thousands and thousands of dollars  
6 for each project.

7 **COMMISSIONER FLEMING:** But who is changing  
8 those rules, is what I –

9 **MR. BRET SOWERS [SO. CURRENT]:** Yeah, and I'll  
10 address that for Ben Snowden.

11 **MR. BEN SNOWDEN:** Thank you, Madam  
12 Commissioner, for the question. The actual  
13 interconnection procedures that were approved by  
14 the Commission, those have not changed, but they  
15 set out the procedures, the process, the timelines.  
16 And they, you know, with respect to the system  
17 impact study, they say the purpose is to study the  
18 electrical – the system impacts. They're sort of  
19 at a very high level about what you should study,  
20 conceptually. There are references to specific  
21 industry standards that are in, I think, it's  
22 Appendix 5 to the procedures. But the procedures  
23 themselves don't say, you know, "Thou shalt study  
24 Issue A, Issue B." You know, "You have to study  
25 voltage change and flicker," and, you know, all

1           these different things. They're not that granular.  
2           It's the utility's own policies that are changing,  
3           and so they have the effect of being – they're like  
4           regulations, only, you know, regulations go through  
5           notice and comment and have to be published and  
6           things like that. I mean, they have the impact of  
7           regulations, but there's not really oversight of  
8           those policies. The policies aren't – they're not  
9           public and they're not made available.

10           So that's what has changed. And I'd say that  
11           those changes have been rolled out in a way that  
12           has sort of blindsided the industry, and we just  
13           haven't really known what the rules are until we  
14           get to the point of being affected by them, and  
15           then they get changed again. So those are the  
16           changes. They're not the actual interconnection  
17           procedures; they're the utilities' policies.

18           **COMMISSIONER FLEMING:** So it's coming from the  
19           utilities.

20           **MR. BEN SNOWDEN:** Yes, ma'am.

21           **COMMISSIONER FLEMING:** And they're doing it in  
22           a way that's not collaborative.

23           **MR. BEN SNOWDEN:** That would be my view of it,  
24           yes. And we are not – we don't disagree with the  
25           notion that impacts have to be studied. I mean,

1           these are – the utilities have to operate the grid  
2           in a safe and reliable fashion, and there's a need  
3           to study things. But we do have differences with  
4           regard to whether these policies are all  
5           technically justifiable, but I think, more  
6           specifically, it is about how those procedures have  
7           been rolled out.

8           **COMMISSIONER FLEMING:** Okay. So it's a result  
9           of the studies that the utilities do.

10          **MR. BEN SNOWDEN:** Yes, ma'am.

11          **COMMISSIONER FLEMING:** And could you talk  
12          about the impact of the HB 489<sub>[sic]</sub> on South Carolina?

13          **MR. BEN SNOWDEN:** Yes, ma'am. So, it's – I  
14          wouldn't say so much that it's impacting the South  
15          Carolina queue right now. So it's a competitive  
16          procurement process that's about 45 months to get  
17          to an obligation. And any project in North  
18          Carolina or in South Carolina, in the service  
19          territory, can bid in.

20                 You know, there may be more projects going  
21                 into the queue in North Carolina, you know, along  
22                 the border, that might be electrically connected  
23                 with projects in South Carolina, but that's not the  
24                 impact. What I was referring to is that there will  
25                 probably need to be – well, if there are not

1 changes made to how the queue in South Carolina is  
2 being handled, there's just not much progress being  
3 made in interconnection and the first tranche of  
4 the CPRE Program, the first group, it's going to be  
5 the summer when the bids have to come back. So you  
6 can't really bid into that process effectively, if  
7 you haven't gotten your study. You don't know what  
8 your costs are going to be, if they're going to be  
9 zero or \$5 million. Developers have to price their  
10 bids, so they need some information.

11 So unless there's some process for getting  
12 that information in a more accelerated fashion,  
13 then the scope of projects is going to be narrower.  
14 And that may be fine. We have been discussing with  
15 Duke the ways to get that done. But I think it's  
16 just very important to the industry that, you know,  
17 whatever – if there are any changes that are  
18 approved by the Commission, since it's up to you  
19 guys to approve any changes, those changes need to  
20 recognize that there's already an existing queue of  
21 projects, a huge queue of projects, that's already  
22 in line to get interconnected, folks who have been  
23 playing by the rules, and that any change should  
24 not negatively impact those projects that are  
25 already in the queue and have, you know, relied on

1 the existing rules to get interconnected.

2 Does that answer your question, more or less?

3 **COMMISSIONER FLEMING:** It's helpful.

4 **MR. BEN SNOWDEN:** Thank you.

5 **CHAIRMAN WHITFIELD:** All right. Thank you,  
6 Commissioner Fleming.

7 Commissioner Hamilton, you don't have a  
8 question, do you?

9 **COMMISSIONER HAMILTON:** Yes, just a short one.

10 **CHAIRMAN WHITFIELD:** Yes, sir. Go ahead.

11 **COMMISSIONER HAMILTON:** I think I'll send this  
12 one to Mr. Sowers. When the solar bill was passed,  
13 the alliance was formed, and the thought by the  
14 Commissioners was a lot of the things that we've  
15 talked about today would be handled within the  
16 alliance. I'm just wondering, what's happening  
17 with the alliance? Tell me where you are.

18 **MR. BRET SOWERS [SO. CURRENT]:** Sure. Are you  
19 specifically talking about the Solar Business  
20 Alliance that I represent?

21 **COMMISSIONER HAMILTON:** Yes, sir.

22 **MR. BRET SOWERS [SO. CURRENT]:** Yeah? And  
23 you're referencing Act 236, in 2014?

24 **COMMISSIONER HAMILTON:** That's right.

25 **MR. BRET SOWERS [SO. CURRENT]:** Okay. So,

1           that legislation did a lot, I think, to jumpstart  
2           the industry here in South Carolina. Where I think  
3           some of these issues are arising is that program  
4           had a relatively small cap on the amount of large-  
5           scale projects that would fall into Act 236. And  
6           since 2014, the industry has grown quite  
7           significantly. In the last eight years, the cost  
8           of the technology has decreased by over 86 percent.

9           We are extremely competitive. As you saw on  
10          one of my slides, the geographical map, 31 states,  
11          we're seeing across the country that mandates  
12          aren't needed for us to enter into. We're signing  
13          very low-cost competitive avoided-cost rates. And  
14          I think, with that, an increased amount of  
15          development has occurred, as we are seeing in our  
16          interconnection queues. And that poses, I think, a  
17          lot of challenges to the utilities. It comes in a  
18          fast nature.

19          I think we tried our best to prepare for that,  
20          as a State. You know, we agreed upon a new  
21          interconnection standard two years ago in  
22          anticipation for some of this increased deployment.  
23          But I think it's a function of the utilities having  
24          to adapt and, quite frankly, so are we as an  
25          industry. I think one of the best things about

1           being in the private sector is we know how to  
2           innovate and we know how to spend a dollar best.  
3           But some of that alliance is fracturing if we  
4           cannot create an atmosphere that's more  
5           collaborative, and who is the leader of that  
6           collaborative kind of nature. I think we've seen  
7           the co-ops in the State try to take that lead and  
8           bring utilities to the table, bring associations  
9           like the Solar Business Alliance.

10           So I guess, increased competition I think is  
11           some of what is happening in a regulated state, and  
12           more independent power producers – there are seven  
13           here, but I mentioned in the Solar Business  
14           Alliance we have 50 companies. Not all of those  
15           companies are independent power producers, but a  
16           lot of them are. And that is a concern, I think,  
17           for the utility, quite frankly. And if I were a  
18           utility, it would be a concern, as well.

19           But I think we have chances to be  
20           collaborative. These interconnection issues, I  
21           really don't see many reasons why we cannot solve a  
22           lot of these problems together. We brought storage  
23           up, and I think you'll continue to hear that.  
24           That's one way. And the best part about all this  
25           is that the price signal, if it is set properly,

1           like Dr. Johnson was mentioning, we have to respond  
2           to that. And if we can't and we can't deliver the  
3           energy capacity needs at that price, then we're not  
4           awarded a contract. And we don't make a single  
5           dollar until we send a kilowatt-hour of electricity  
6           to the grid.

7           So we bear all those costs and burdens, and I  
8           think that's just a fundamental shift throughout  
9           the nation. And that's – you know, that's why  
10          we've seen a lot of markets go to deregulated  
11          markets; you kind of just allow a lot of  
12          competition. We're not recommending that here for  
13          South Carolina. I think we can work on a better  
14          solution, but I think we need a strong advocate to  
15          bring all the parties back to the table again.

16          **COMMISSIONER HAMILTON:** So you think the  
17          problems that we have now exceed the ability to be  
18          solved in the alliance.

19          **MR. BRET SOWERS [SO. CURRENT]:** No, I think we  
20          can solve them in the alliance. Yes, absolutely.  
21          I think we have to have a reset in the State.

22          **COMMISSIONER HAMILTON:** Sounds like today  
23          would be a good day for a reset.

24          **MR. BRET SOWERS [SO. CURRENT]:** Could be.

25          **COMMISSIONER HAMILTON:** Thank you.

1 Thank you, Mr. Chairman.

2 **CHAIRMAN WHITFIELD:** Thank you, Commissioner  
3 Hamilton.

4 Again, I would remind everybody, we're a  
5 little bit over the timeframe that Mr. Whitt had  
6 laid out and that we had anticipated, but I do  
7 understand that Commissioner Elam has one quick  
8 question, and we are digging into the other panel's  
9 time a little bit, so let's do try to wrap it up.

10 **COMMISSIONER ELAM:** Dr. Johnson, did I  
11 understand you to say that you believe South  
12 Carolina ratepayers need to be bearing more of the  
13 risk of the development of solar than they are  
14 currently?

15 **DR. BEN JOHNSON [BEN JOHNSON ASSOC'S]:** No. I  
16 was probably talking too fast. I was trying to  
17 stress that South Carolina ratepayers bear none of  
18 the risk of solar, whereas they continue to bear  
19 all of the risk of gas- and coal-fired plants. The  
20 nature of the system is just fundamentally  
21 different.

22 **COMMISSIONER ELAM:** Okay. Thank you.

23 **CHAIRMAN WHITFIELD:** Thank you, Commissioner  
24 Elam.

25 I don't think there's anything further. I do

1 think you've had a – you've certainly had a very  
2 informative panel; all three of you have been great  
3 panelists. And I do think that the Commissioners  
4 probably do have some other questions that maybe  
5 you could, in a future allowable ex parte, maybe  
6 you could come back. But I know that some of the  
7 presentations have sparked a lot of interest, and  
8 we certainly appreciate the perspective all three  
9 of you – particularly, a couple of you – have  
10 expressed, between the two states, since we do have  
11 overlapping jurisdictions by a couple of utilities  
12 with North Carolina. And then also you referenced  
13 the PJM territory in North Carolina. Anyway, we  
14 certainly appreciate that perspective.

15 However, before you do step down, I do have  
16 one quick, pointed question, I believe for you, Mr.  
17 Sowers, and I think it's going to be a quick  
18 answer. You referenced \$5.2 billion investment –  
19 planned investment in South Carolina. By what  
20 timeframe do you expect to – when do you expect to  
21 hit that \$5.2 billion investment in South Carolina?

22 **MR. BRET SOWERS [SO. CURRENT]:** So, a lot of  
23 it depends on the jurisdiction in which it's in.  
24 As we mentioned – I'll try to keep this brief.

25 **CHAIRMAN WHITFIELD:** Yes.

1                   **MR. BRET SOWERS [SO. CURRENT]:** – the  
2                   interconnection process is critical to when that  
3                   investment comes into the State. We’ve seen some  
4                   of it already occur, in certain jurisdictions where  
5                   the interconnection standards are being followed  
6                   routinely and succinctly, in time, and other  
7                   jurisdictions where that has not occurred. If we  
8                   follow the interconnection standards as described  
9                   today and their timelines, you will see that \$5.2  
10                  billion come into South Carolina over the next  
11                  three to four years.

12               **CHAIRMAN WHITFIELD:** Less than five years.

13               **MR. BRET SOWERS [SO. CURRENT]:** Correct.

14               **CHAIRMAN WHITFIELD:** All right. Well, thank  
15               you. That’s all I have. And, again, I’d like to  
16               thank all three of you. It’s been very  
17               informative. And you may step down. I’ll let Mr.  
18               Whitt call his next panel.

19                               [WHEREUPON, Messrs. Sowers and Snowden  
20                               and Dr. Johnson stood aside.]

21               **MR. WHITT:** Thank you, Mr. Chairman. We’ll  
22               call Paul Esformes, who is with EcoPlexus, and  
23               we’ll call Steve Levitas, who is with Cypress  
24               Creek.

25               **CHAIRMAN WHITFIELD:** Mr. Whitt, I’m sorry.

1 Our court reporter does need just a brief two-to-  
2 three-minute break. They can come forward and get  
3 set up, and we'll resume just after a few minutes,  
4 but we do need to allow for a break, for her, just  
5 for a minute or two.

6 [WHEREUPON, Messrs. Esformes and Levitas  
7 came forward.]

8 [WHEREUPON, a recess was taken from 3:50  
9 to 3:55 p.m.]

10 **CHAIRMAN WHITFIELD:** Mr. Whitt, before you  
11 start with your next panel, the Commission does  
12 want you to know that we find this – all of us find  
13 this very informative. And, again, we apologize  
14 for having to be brief, not only with our questions  
15 but making your panelists – and I know you had laid  
16 the outline out yourself; it's nothing we  
17 requested. But I do want you to know the  
18 Commission is very interested in your presenters,  
19 and that perhaps, maybe at a future time, there  
20 could be another one to follow up. I know it's  
21 been about a year since we've had at least one or  
22 two of them here, and perhaps you could work with  
23 staff to do a follow-up, because they have brought  
24 a wealth of information and you've had a lot of  
25 panelists, and perhaps we could do something in the

1 future. But the Commission does want to relay that  
2 to you, and we are eager to hear from your  
3 remaining panelists, and we thank you for putting  
4 this together.

5 **MR. WHITT:** Thank you, Mr. Chairman. I guess  
6 we were doing annual; maybe we need to do  
7 semiannual, and maybe do one in the fall. So we'll  
8 certainly consider that, and we appreciate your  
9 time. And, certainly, the time is important for my  
10 clients, but we were trying to recognize that we  
11 understood that the court reporter had a long drive  
12 and had a night, last night. So we do appreciate  
13 your time, though.

14 We have Paul Esformes from EcoPlexus and Paul  
15 Levitas from Cypress Creek.

16 **CHAIRMAN WHITFIELD:** Thank you.

17 Mr. Esformes, I guess if you want to go first,  
18 go ahead with your presentation.

19 **MR. PAUL ESFORMES [ECOPLEXUS]:** Thank you, Mr.  
20 Chairman. Thank you, Commissioners, for the  
21 opportunity to be here to speak with you about  
22 issues of importance to my company and two other  
23 developers within the industry.

24 **CHAIRMAN WHITFIELD:** Mr. Esformes, could you  
25 pull that microphone just a little bit closer,

1           please?

2                   **MR. PAUL ESFORMES [ECOPLEXUS]:** [Indicating.]

3           My name is Paul Esformes. I'm an attorney with  
4           EcoPlexus, Incorporated, a utility-scale developer  
5           with projects throughout the country, as well as  
6           South Carolina. I'm based in our Durham, North  
7           Carolina, office, and the company is headquartered  
8           in San Francisco.

9                   [Reference: Presentation Slide 18]

10          So, I wanted to start by backing up a few  
11          steps just to focus briefly in one of the issues of  
12          critical importance to developers in our industry,  
13          and that is the length of contracts. Having a  
14          contract of sufficient term can be one of the  
15          primary factors that determines whether a project  
16          is financeable and whether it gets built in the  
17          first place.

18          It is worth remembering that the vast majority  
19          of the power purchase agreements that are signed  
20          with utilities are financed by third parties. And  
21          while it may be just the utility and the developer  
22          at the table, the developer is represented by banks  
23          and lenders who also have their own standards that  
24          they are working towards. So, quite simply, a  
25          longer-term loan allows the developer to generate

1 enough capital to pay off debt and accumulating  
2 interest while still supporting the ongoing O&M, or  
3 operating and maintenance. So all other things  
4 being equal, lenders are willing to offer less  
5 expensive debt for a contract with a longer PPA  
6 term.

7 The graph on the right-hand side of that slide  
8 just shows the direct correlation between contract  
9 term and the rate of return for the investor. The  
10 investor needs a certain amount of return to make  
11 the investment worthwhile to go forward. So, in  
12 other words, a longer-term contract is not just  
13 nice to have, it's effectively a minimum  
14 requirement for a project to go forward. And  
15 that's borne out in practice, both for our company  
16 and throughout the industry. Of the roughly 75  
17 projects that we've financed in five states, the  
18 average term is approximately 23 years. So,  
19 nationwide, based on some survey information, only  
20 a small fraction of projects nationwide have a PPA  
21 term of less than or equal to 10 years, and the  
22 vast majority have terms of 15 years or more.

23 [Reference: Presentation Slide 19]

24 And then I wanted to just bring up one refrain  
25 that we hear from utilities: that a longer-term PPA

1 exposes ratepayers to the risk that energy prices  
2 may go down in the future. There seems to be a  
3 concern about locking ratepayers into so-called  
4 high-price contracts. I think this is based on  
5 some misconceptions and misses the boat on the  
6 exact risks that are out there.

7 So, energy prices are, admittedly, very  
8 volatile and driven by a number of external  
9 factors. And, quite simply, a longer-term contract  
10 hedges against price volatility both on the upside  
11 and the downside. Moreover, PPAs that are signed  
12 through the PURPA process are, by definition, cost-  
13 competitive or cost-effective because they are at  
14 or below the avoided cost.

15 [Reference: Presentation Slide 20]

16 So, looking ahead to innovative programs to  
17 bring more renewable energy to customers in South  
18 Carolina, one thing we wanted to highlight for you  
19 – and my colleague, Steve Levitas will be  
20 discussing that in further detail – is a green  
21 tariff or a green source rider. It's a program  
22 that allows customers to elect to have a higher  
23 rate of renewable energy purchased through the  
24 utility on their behalf. It's currently being  
25 considered by the South Carolina Legislature in

1 Bill No. 987. Typically, it's used by large  
2 customers, such as a corporate client – a Google or  
3 a Facebook – but it can be offered to any size  
4 customers.

5 It offers a number of benefits for ratepayers,  
6 as well as utilities and developers. First and  
7 foremost, it's a voluntary program. It allows  
8 customers that choose to, to go above and beyond  
9 the renewable mix that's offered by the utility and  
10 to choose more. It works within the existing  
11 utility-customer relationship, which is quite  
12 important. It uses the purchasing power and  
13 expertise of the utility, their buying power, the  
14 size of the load that they are purchasing. It also  
15 uses the existing billing relationship that the  
16 utility has with the customer. And it's  
17 transparently priced, because it's done through  
18 rates. So the customer can see, on a monthly  
19 basis, how much additional amount they're using to  
20 purchase for that program. And, again, because  
21 it's a voluntary program and it is defined through  
22 rates, there's no cost shift to customers who do  
23 not participate in the program, or choose not to do  
24 so.

25 [Reference: Presentation Slide 21]

1           This next slide just has a map of nationwide  
2           programs that are offering a green tariff. It's  
3           currently being offered in 15 states. This  
4           information is as of a month ago, I believe. And  
5           the darker green states are states where the  
6           programs have been implemented and PPAs directly  
7           for the program have been signed. The crosshatched  
8           states are ones where it's been implemented but the  
9           PPAs are still pending, have not yet been signed.

10           [Reference: Presentation Slide 22]

11           So, moving on to one more innovative program.  
12           You've heard already today about the opportunities  
13           with energy storage. It's certainly one of the  
14           prime candidates. It's a common refrain in the  
15           industry that storage is what solar was 10 years  
16           ago. And that was true five years ago when storage  
17           was primarily associated with pilot programs in  
18           research and development, and the focus was on  
19           containing the costs associated with it. It's also  
20           true today, where storage and, particularly, solar  
21           plus storage is increasingly becoming a preferred  
22           resource, and the scale of the implementation and  
23           the developments of projects that are coming on-  
24           line is growing dramatically.

25           The middle of that slide just highlights a

1           number of the potential use cases for storage. Dr.  
2           Johnson explained the basic principle of storage  
3           being able, when coupled with solar, to be able to  
4           draw from the system at one time of day and  
5           discharge into the system at another. There are a  
6           number of other use cases for different types of  
7           customers. For instance, backup power for large  
8           commercial facilities, micro-gridding for a remote  
9           community, voltage support and control.

10           Storage is still being studied and developed,  
11           and the technology is increasing dramatically, and  
12           the use cases are also increasing along with that.  
13           There are a number of different customers.

14           That said, there are a number of challenges  
15           still out there, both technical, economic, as well  
16           as regulatory. I believe Dr. Johnson touched on a  
17           number of the technical factors in his  
18           presentation, as well.

19           [Reference: Presentation Slide 23]

20           I won't go into too much detail on this slide,  
21           but it shows the dynamic on the left-hand side that  
22           Dr. Johnson was explaining, of solar plus storage  
23           and how that can draw from the system in low-value  
24           hours and then discharge into the system in high-  
25           value hours, effectively acting as both demand and

1 supply. And that can address the ramping period,  
2 which we see in states like California, with high  
3 solar penetration, to address the duck curve.  
4 It's also being looked at to replace new peaker  
5 plants, whether that's natural gas or coal, and  
6 then to retire existing plants for that same  
7 purpose.

8 [Reference: Presentation Slide 24]

9 A few statistics for you, just on the rapid  
10 growth of energy storage: Annual installations grew  
11 from just 340 megawatts in 2013 and 2012, to 6  
12 gigawatts in 2017. That's projected to rise to 40  
13 gigawatts by 2022. That adoption is driven by the  
14 declining technology costs, but also by state  
15 policy and state regulations. At the national  
16 level, FERC Order 841, which was issued just  
17 recently, instructs the RTOs and ISOs to remove the  
18 barriers in the wholesale markets for energy  
19 storage to be able to participate.

20 At the state level, a recent survey showed  
21 that 32 states took some action on energy storage  
22 in just 2017 alone, and that can range anywhere  
23 from further study to investigate the  
24 opportunities, all the way to mandating procurement  
25 of energy storage. So there are a lot of

1 opportunities out there for states to have a role  
2 in driving that innovation.

3 [Reference: Presentation Slide 25]

4 Now I'd like to turn it over to our next  
5 presenter.

6 **MR. STEVE LEVITAS [CYPRESS CREEK RENEWABLES]:**

7 Good afternoon. Let me get turned on here  
8 [indicating].

9 **CHAIRMAN WHITFIELD:** Yes, sir, Mr. Levitas.

10 **MR. STEVE LEVITAS [CYPRESS CREEK RENEWABLES]:**

11 Good afternoon, Mr. Chairman, members of the  
12 Commission. I'm Steve Levitas. I'm the senior  
13 vice president for Regulatory Affairs and Strategy,  
14 with Cypress Creek Renewables. Cypress Creek is  
15 one of the largest utility-scale developers in the  
16 country and one of the most active developers here  
17 in South Carolina and across the Southeast.

18 You've heard about a number of the issues and  
19 challenges that we face as an industry, doing  
20 business here in the State. I want to finish our  
21 presentation by talking about a couple of  
22 solutions, solutions in the form of two pairs of  
23 bills, companion bills, that are currently pending  
24 in the South Carolina General Assembly.

25 The first pair of those bills is Senate Bill

1 890 and its companion House Bill 4796. These are  
2 bills that deal with the State implementation of  
3 the federal PURPA law, the Public Utilities  
4 Regulatory Policy Act, which Mr. Snowden mentioned  
5 earlier in the program and I'm sure you're all  
6 familiar with to some extent.

7 In a nutshell, what PURPA does is to require  
8 electric utilities to buy the output of certain,  
9 quote, "Qualifying Facilities," which are mostly  
10 cogeneration and renewable facilities below 80  
11 megawatts. So it requires that the utilities buy  
12 our output at what is called avoided cost. And  
13 that's what Dr. Johnson spoke about. And the  
14 purpose behind PURPA was a recognition by Congress  
15 several decades ago that there was significant  
16 value in incentivizing the development not only of  
17 these alternative energy resources but also of  
18 independent power production to create more  
19 competition and more market participation than  
20 we've had with our traditional monopoly control of  
21 generation across much of the country,  
22 historically.

23 So the other important thing to say about  
24 PURPA is that it was intentionally conceived as a  
25 collaborative regulatory regime between federal

1 government and the states. So the basic contours  
2 and ground rules of PURPA are established in the  
3 legislation itself in Congress and by FERC in  
4 implementing – Federal Energy Regulatory Commission  
5 – in implementing orders and rules, but then a good  
6 bit of the detail is left to you and your  
7 counterparts across the country as state regulatory  
8 bodies to flesh out and implement PURPA in  
9 accordance with the federal guidance. And among  
10 the most important aspects of your job in that  
11 federal-state partnership is the establishment of  
12 the avoided cost, which Dr. Johnson described,  
13 which is essentially what we get paid for the power  
14 that we put on the grids of utilities.

15 So what will these bills do? The first thing  
16 – and I’m sorry. I’ve got a slide that helps  
17 answer that question.

18 [Reference: Presentation Slide 26]

19 The first thing that these bills would do  
20 would be to formalize the process by which you, as  
21 the Commission, would establish avoided cost, and  
22 that would be both the methodology for determining  
23 avoided cost, which is a complex subject – you all  
24 have devoted a good bit of time to that, but  
25 there’s several different approaches that are

1 recognized. So there's a threshold question of  
2 what should the methodology be, and then applying  
3 that methodology to establish the actual avoided-  
4 cost rates that get paid to what are called the  
5 standard-offer projects.

6 And the slide doesn't mention, but in the  
7 legislation it's proposed that those – across the  
8 board, that that standard-offer threshold be 5  
9 megawatts. So for 5 megawatt projects, every two  
10 years, you would set the rates; those rates would  
11 be in place for two years. For other projects  
12 above the 5 megawatt threshold, the same  
13 methodology that you would establish would be used  
14 to determine the rates, but they would be adjusted  
15 on an ongoing basis, rather than it being fixed  
16 over that two-year period. There would – I said  
17 fixed over the two-year period; the methodology  
18 would be fixed, but actually the legislation also  
19 provides that the inputs – so natural gas prices  
20 and costs of other plants – would be updated on a  
21 biannual basis. So you deal with the methodology  
22 and then you kind of refresh every two years, and  
23 then every six months, as, for example, at least  
24 one of the utilities I know currently does that in  
25 South Carolina today, they would come in and update

1 the inputs that go into that methodology. So the  
2 idea is to get a clear set of rules and guidelines  
3 for implementing this program so that everybody  
4 knows how it's going to work for all the utilities  
5 in the State.

6 Another important element, moving down to the  
7 next part of this slide, of what the legislation  
8 would do on this, would be to have you, as the  
9 Commission, as the overseer of this process,  
10 approve standard contracts and make a determination  
11 as to the terms that are commercially reasonable  
12 that would be in those contracts. And that's a  
13 really big issue for our industry, because,  
14 frankly, we have one buyer on the other side of our  
15 transaction. And it's a very large, powerful  
16 buyer. And they hold all the cards in the  
17 negotiation of what those contract terms would be.  
18 So we think, and the legislation reflects the  
19 belief, that it's very important to have commission  
20 oversight of those contract terms, to be sure that  
21 they are fair and reasonable to all parties.

22 In addition to speaking to the issue that Mr.  
23 Esformes raised, the legislation also provides that  
24 the length of those contracts would be set at 15  
25 years. So right now, in South Carolina, there's

1 not, across all utilities, a standard default  
2 contract length to ensure that these contracts are  
3 financeable. And I will just add that FERC – the  
4 Federal Energy Regulatory Commission – has  
5 established as one of those federal principles that  
6 state commissions have to comply with, is that the  
7 contracts have to be – this is – I’m quoting pretty  
8 much directly – a PURPA contract has to be of  
9 sufficient length to give the Qualifying Facility a  
10 reasonable opportunity to attract capital to build  
11 its project. And so, Mr. Esformes had that slide  
12 showing how contract length drives rates of returns  
13 and, thus, financeability and your ability to get  
14 an investor to invest in a project.

15 Finally, with respect to these bills, there  
16 are several provisions that go to another federal  
17 PURPA requirement of nondiscriminatory treatment of  
18 QFs. So the three items I have noted there, one is  
19 that there be limitations on the utility’s ability  
20 to curtail the output from our solar facilities.  
21 It’s critically important to us that we know we’re  
22 going to be able to sell the output and get paid  
23 for it, in order to be able to finance it. And  
24 PURPA does establish, by legislation and rule, very  
25 strict limitations on the circumstances under which

1 a utility can curtail QF output. We want to be  
2 sure that that federal law is implemented here in  
3 South Carolina, and that's what the legislation  
4 would do.

5 Secondly, Mr. Snowden talked about the problem  
6 with interconnection delays, and the fact that  
7 circumstances that are completely beyond our  
8 control could cause us to be unable to meet  
9 deadlines that are in contracts, possibly be in  
10 default, possibly face damages, possibly lose the  
11 benefit of rates that we qualified for and believed  
12 we were eligible for and made our development  
13 investments on the basis of those rates. And, so,  
14 an additional provision of these bills would be  
15 that the QFs could not be held responsible for  
16 these interconnection delays beyond their control.

17 And then, finally, there's a provision in the  
18 bills that says that the avoided-cost rates can't  
19 be reduced just because the power that comes from  
20 our facilities is intermittent in nature. There's  
21 been some proposals to that effect. And the  
22 concern there is that, yes, there's the possibility  
23 that intermittent power could have some cost to the  
24 system, but there are a whole range of benefits  
25 that these solar facilities provide to the system

1           that are not considered as part of the avoided-cost  
2           calculation and the contract price, either. So the  
3           legislation wouldn't allow that one possible impact  
4           for cost to be singled out for special treatment  
5           and used to reduce the price that would be paid  
6           under these PPAs.

7                               [Reference: Presentation Slide 27]

8           So turning now to the second pair of bills –  
9           Senate Bill 987 and House Bill 5001 – these bills  
10          address exactly the green source program that Mr.  
11          Esformes talked about. And just to reiterate what  
12          he said, what's going on with this concept and with  
13          these bills is figuring out a way to meet the huge  
14          demand from commercial, industrial, institutional  
15          customers, all of whom are clamoring for green  
16          energy.

17          You read the newspapers, you know that a huge  
18          percentage of Fortune 100 companies insist, have as  
19          corporate principles, that they are going to be  
20          powered by green energy. That's true of academic  
21          institutions, and their students are pressuring  
22          them to go green and have clean energy. And the  
23          problem is that, in a regulated market like South  
24          Carolina, where a customer can't buy directly from  
25          a generator of green energy like us, the only way

1           that they can accomplish their corporate goals –  
2           and I would submit to you, the only way that  
3           they're going to come do business in South Carolina  
4           in the future – is if you give them another pathway  
5           to be able to claim that their facilities are  
6           powered by green energy.

7           And through policy development, as Mr.  
8           Esformes said, in a number of states across the  
9           country, a very elegant mechanism has been  
10          developed that everybody agrees, I think, works to  
11          accomplish this goal. And it's really a three-way  
12          arrangement where, essentially, it works like this  
13          – and I've got a little graphic at the end that  
14          maybe will make it easier to follow. But the way  
15          it works is this – and this is all laid out in the  
16          legislation. The customer goes to a company like  
17          any of ours, and makes an arrangement and says, "I  
18          want to have your output dedicated for my use." So  
19          we're going to sell it to the utility. I'm still  
20          going to buy from the utility, but your output will  
21          be earmarked, dedicated, for my use. And I, as the  
22          customer, will be able to negotiate the price that  
23          I pay for that, as well as the length of the term  
24          of my contract. And so the parties will enter into  
25          this three-way arrangement where, as I said, the

1 customer is still buying its power from the  
2 utility. It has this agreement with the renewable  
3 energy supplier who's selling its output to the  
4 utility.

5 The bill provides that these arrangements,  
6 these three-way contracts, could be between two and  
7 twenty years, at the option of the customer. And  
8 the way it basically works – it's a little  
9 complicated – the customer would continue to pay  
10 its full retail rate. And that's really important,  
11 because what that means is the rest of the  
12 ratepayers, of the consuming public, would not be  
13 affected in any way, because the customer would  
14 continue to pay into the system the full amount of  
15 its portion of the utility revenue requirements,  
16 based on the established rates. But what would  
17 happen is the customer would also pay the price of  
18 our PPA but then get a bill credit back based on  
19 the utility's avoided cost.

20 So where we are willing to contract and sell  
21 our power below that avoided-cost number, there's a  
22 savings that can accrue to the customers. And I  
23 can promise you this is very important to these  
24 large users who want to come locate in your State.  
25 If, on the other hand, our PPA price were above the

1           avoided-cost rate, in that circumstance the  
2           customer would have to pay a premium.

3           There are a few other details of the program  
4           set out on the right side of this slide. Again, as  
5           with the other set of bills, the PURPA bills, this  
6           bill would provide for you, as the Commission, to  
7           establish approved standard terms and conditions  
8           for these contracts.

9           I mentioned in the third bullet that the  
10          utility can't charge nonparticipating customers in  
11          any way; they are held harmless. The participating  
12          customer would be limited to 125 percent of its  
13          most recent annual energy usage, and there is a cap  
14          in the legislation so that once the utility hit 10  
15          percent of its five-year average through these  
16          types of programs, the program would be suspended,  
17          or its obligation to expand the program would end.

18          And then, just quickly, to maybe make this a  
19          little bit clearer –

20                 [Reference: Presentation Slide 28]

21          – this graphic just shows the three-way  
22          relationship that I described. So, you start at  
23          the bottom: The renewable energy supplier and the  
24          participating customer reach an agreement about  
25          price and contract length. The utility then enters

1           into a power purchase agreement relationship with  
2           the renewable energy supplier at that agreed-upon  
3           price. And the customer then pays, as I said –  
4           that orange line – is paying its existing retail  
5           rate. It also pays the full price, the green of  
6           the bundled PPA price, but then gets that avoided-  
7           cost generation credit back, and then pays a modest  
8           administrative fee.

9           This is a mechanism that is being implemented  
10          or looked at in many, many states across the  
11          country, including North Carolina where there are  
12          active proceedings to implement a new green source  
13          program. And I would submit to you that, as long  
14          as this is going to remain a regulated market where  
15          renewable suppliers cannot sell directly to large  
16          retail customers, it's extremely important that  
17          this type of program be implemented to meet the  
18          needs of your large customers and companies who  
19          want to come do business here.

20          So I will stop there. Thank you very much.  
21          We'll be happy to take any questions.

22                 **CHAIRMAN WHITFIELD:** Thank you, Mr. Levitas  
23                 and Mr. Esformes.

24                 At this time, we'll take a few minutes for  
25                 Commissioner questions. Commissioners, questions

1 for these two panelists? Commissioners?

2 **COMMISSIONER FLEMING:** Yes.

3 I wanted to ask you if you could go into a  
4 little bit more detail on the bill about utility  
5 delays, the interconnection delays that the solar  
6 company or – or the PPAs, I guess – not the PPAs,  
7 but the independent power producers would not be, I  
8 guess, penalized for the delay. So, could you  
9 explain how that goes? I mean, are you saying that  
10 you'll still be in your same position in the queue?  
11 What will you do about – if you're delayed, you're  
12 still not getting money, so what is going to happen  
13 there? Could you just talk a little bit about what  
14 that means and how you think it's beneficial to  
15 you, and what you expected to get out of it?

16 **MR. STEVE LEVITAS [CYPRESS CREEK RENEWABLES]:**

17 Sure. Thank you for that question, Commissioner  
18 Fleming. The bill is not a complete solution by  
19 any means to the problems that Mr. Snowden outlined  
20 with respect to interconnection delays. So it  
21 actually does nothing to try to change the  
22 interconnection standards, to expedite processing  
23 or to create tighter timelines or create any sort  
24 of penalties for failure to process in a certain  
25 time. So, it deals with a very – the narrow issue

1 of the potential adverse consequence to us of these  
2 interconnection delays. And Mr. Snowden outlined  
3 what those potential consequences are.

4 The bill actually does not deal with that  
5 issue of the potential loss of a rate, so one big  
6 concern that we have is that there's a rate in  
7 effect, but there's a length of time associated  
8 with that, and we could potentially lose  
9 eligibility for that rate because the clock gets  
10 run out through these long interconnection delays.

11 But what the bill does address are the other  
12 two problems that Mr. Snowden mentioned, which is  
13 the possibility that you've got a contract and one  
14 of the contract terms says, "Thou shalt have this  
15 project delivering power to the grid by December  
16 31st, 2018," and we've done everything we can do –  
17 we've designed the project, we've obtained the  
18 financing, we have the panels ordered, maybe  
19 sitting in the port, and we're ready to go to work  
20 and build this, and we're waiting and we're waiting  
21 and we're waiting for interconnection, for the  
22 study to be complete or for interconnection  
23 facilities to be constructed. And so what the bill  
24 addresses in the scenario, in that case, is the  
25 worst of all possible worlds, to add insult to

1 injury, would be for the utility to be able to come  
2 to us and say, "You didn't make the deadline.  
3 We're terminating your contract and we're  
4 subjecting you to huge damages because you didn't  
5 deliver this project on time." So what the bill  
6 would say is they can't do that, where the reason  
7 that we miss a deadline is because of their own  
8 interconnection delays.

9 **COMMISSIONER FLEMING:** But they can do that  
10 today.

11 **MR. STEVE LEVITAS [CYPRESS CREEK RENEWABLES]:**  
12 That's right.

13 **COMMISSIONER FLEMING:** And I'm going to ask –  
14 I've heard – well, and it's been stated in hearings  
15 here before, that there are not delays with one of  
16 our companies, so are most of your concerns with  
17 these interconnections primarily with another  
18 company?

19 **MR. STEVE LEVITAS [CYPRESS CREEK RENEWABLES]:**  
20 Well, I believe we've been instructed not to talk  
21 about specific companies, but –

22 **COMMISSIONER FLEMING:** Well, we're not.

23 [Laughter]

24 All right, let me – I'll think about how I can  
25 ask this.

1 [Pause due to electronic technical difficulty]

2 **MR. WHITT:** Mr. Chairman, can we just say that  
3 that question's – we appreciate all of your  
4 questions, but that's better left for a specific  
5 hearing?

6 **CHAIRMAN WHITFIELD:** Okay.

7 Commissioner Fleming, I believe – we're sorry  
8 for the technical difficulty there. Commissioner  
9 Fleming, I think, was still questioning you. Do  
10 you have any further questions for this panel,  
11 Commissioner Fleming?

12 **COMMISSIONER FLEMING:** No, I think these bills  
13 address the issues across the board, correct?

14 **MR. STEVE LEVITAS [CYPRESS CREEK RENEWABLES]:**  
15 That's correct.

16 **COMMISSIONER FLEMING:** Thank you.

17 **CHAIRMAN WHITFIELD:** Thank you, Commissioner  
18 Fleming.

19 Any other questions from Commissioners, from  
20 this last panel?

21 [No response]

22 Well, if not, again, very informative, as was  
23 the first panel, and we thank you for your  
24 presentations and bringing this information to us.  
25 And you may step down.

1 [WHEREUPON, Messrs. Esformes and Levitas  
2 stood aside.]

3 And I'll turn it back to Mr. Whitt.

4 **MR. WHITT:** Thank you, Mr. Chairman and  
5 members of the Commission, Ms. Wheat, and Andrew  
6 Bateman. Thanks to everyone for your time, and we  
7 would request a transcript of this hearing.

8 **CHAIRMAN WHITFIELD:** So noted, Mr. Whitt.

9 And, Mr. Bateman, is there anything further  
10 from ORS?

11 **MR. BATEMAN:** Nothing from ORS.

12 **CHAIRMAN WHITFIELD:** If nothing further, this  
13 allowable ex parte briefing is adjourned. And Mr.  
14 Woods reminds me, for each and every one of you in  
15 attendance today, to please make sure you give him  
16 your signed sheet back before you leave this room.  
17 And he, along with ORS Staff, will be certifying –  
18 he will be getting that to ORS to certify. So  
19 please make sure that we are in compliance with all  
20 allowable ex parte briefing laws.

21 And thank you. Briefing adjourned.

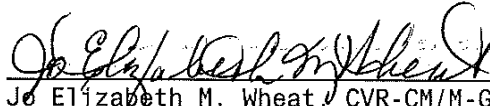

22 [WHEREUPON, at 4:30 p.m., the proceedings  
23 in the above-entitled matter were  
24 adjourned.]

25

C E R T I F I C A T E

I, Jo Elizabeth M. Wheat, CVR-CM-GNSC, do hereby certify that the foregoing is, to the best of my skill and ability, a true and correct transcript of all the proceedings had in an Allowable Ex Parte Proceeding held before THE PUBLIC SERVICE COMMISSION OF SOUTH CAROLINA in Columbia, South Carolina, according to my verbatim record of same.

IN WITNESS WHEREOF, I have hereunto set my hand, on this the 15<sup>th</sup> day of March, 2018.

  
Jo Elizabeth M. Wheat, CVR-CM/M-GNSC  
Hearings Reporter, PSC/SC  
My Commission Expires: January 27, 2021.
